ZETAERP · TEAM GUIDE

How to Use the @claude Helper Bot

A super-simple guide. Read it once and you'll know exactly how to ask our AI helper for anything — right inside GitHub. No coding needed.

🤖 **Just type @claude and it wakes up**

0 What is this, in one breath?

Claude is a smart helper (an AI robot) that lives inside our project on GitHub. You "talk" to it by writing **@claude** in a comment — exactly like tagging a teammate. It reads what you wrote, does the work, and writes an answer back. That's it.

1 Before you start (nothing to install)

- You only need your **GitHub account** and to be a member of the project (if you can open the repo, you're in).
- You do **not** install anything. It all happens in your web browser on `github.com`.
- Our project lives here: `github.com/amalnathkp13-boop/zenith-erp`

2 The ONE rule to remember

> **Your message must contain `@claude`.** That word is the "wake-up" word. No `@claude` = the bot stays asleep and ignores your comment.

3 Where can you talk to it?

Anywhere you can leave a comment on the project:

- Inside an **Issue** (a ticket — a question, task, or bug report)
- Inside a **Pull Request** (a proposed change waiting for review)
- In any **reply/comment** under those

4 How to ask — step by step

1. Open the project: `github.com/amalnathkp13-boop/zenith-erp`
2. Click the **Issues** tab (or **Pull requests**). Open one, or click **New issue**.
3. Scroll to the comment box at the bottom.
4. Type your request, **starting with `@claude`**.
5. Click the green **Comment** button.
6. Wait about **10–30 seconds**. Claude replies right there in a new comment. 🤖

5 Copy-paste examples (the useful part)

ASK A QUESTION

```
@claude what does the file SalesMode.xml do?
```

ASK FOR A SIMPLE EXPLANATION

```
@claude explain in simple words how the POS billing screen works
```

ASK IT TO MAKE A CHANGE (IT OPENS A PULL REQUEST FOR REVIEW)

```
@claude add a line at the top of README.md that says "Internal use only"
```

ASK IT TO REVIEW A PULL REQUEST

```
@claude review this pull request and tell me if anything looks risky
```

6 What happens after you ask

- **Step 1:** You see "*I'll analyze this and get back to you.*" — that means it started working.
- **Step 2:** A green check ✓ appears and the real answer is posted as a comment.
- **Step 3 (only if it changed code):** it gives you a **Pull Request link**. Nothing goes live until a human reviews and merges it.

7 What it CAN and CANNOT do

✓ It CAN

- ✓ Answer questions about the project
- ✓ Explain code in plain words
- ✓ Write or change files — as a Pull Request
- ✓ Review a Pull Request for problems

✗ It CANNOT

- ✗ Push straight to `master` (our rule)
- ✗ Deploy to the live website
- ✗ Edit the workflow / automation files
- ✗ Do anything outside this project

8 Golden tips (for best results)

- **Be specific.** "Fix the bug" is weak. "In CreditBills.xml the total shows wrong when quantity is 0 — please fix" is strong.
- **One task per message.** Ask for one thing at a time.
- **Always start with `@claude`.** (Yes, again — it's the #1 thing people forget.)

Heads-up: every request uses the owner's Claude account credits, so please don't spam it with test messages. Use it for real work.

9 If it doesn't reply (quick fixes)

- **Did you write `@claude`?** This is the most common reason. No tag = no reply.
- **Give it a minute.** It can take up to ~60 seconds on a busy day.
- **See a red ✗ instead of a green ✓?** Click **"View job"** in the bot's message to see what happened, or just ping **Amalnath** (the owner).

10 Safety rules (please follow)

Never paste secrets. No passwords, no customer data, no GSTIN/PAN, no API keys in a comment. Comments are visible to the whole team and are permanent.

You're safe from breaking things. Claude only *proposes* changes as Pull Requests. It cannot touch the live system, and every change is reviewed by a human before it goes anywhere.

11 How to add files (docs, PDFs, pictures) to the project

Want the bot or your team to have a file? You don't upload it "into" the bot — you add it to the project on GitHub, and then everyone (Claude included) can see it. Easy browser way, **no tools needed**:

1. Open `github.com/amalnathkp13-boop/zenith-erp` and click the **docs** folder.
2. Click **Add file › Upload files**.
3. **Drag** your files in together — the `.md`, the `.pdf`, and pictures (`.png` / `.jpg`).
4. Type a short note like "*add Claude bot guide + images*".
5. Choose **"Create a new branch and start a pull request"** (our `master` is PR-only), then **Propose changes**.
6. Open the Pull Request and **merge** it (or ask the owner). Done — the files are in the project. ✅

Where things go: guides, PDFs and pictures all go in the `docs/` folder. On GitHub, a `.md` shows as a neat web page, pictures show inline, and a PDF gets a **Download** button.

Not the place for docs or pictures: the `.claude/agents/` folder is a special, advanced spot that only holds bot *instruction* files (plain `.md`). Never put PDFs or images there.
